                                                                      The sequences given in AAR26448 and AAR26449 are encoded by genes which were used in the construction of an expression plasmid pMONI1030 which was used to transform petunia plants. This plasmid contained the genes for chloroplast transit peptide (CTD2) (AAR26448) and the CP4 synthetic 5-enclpyruvyl-3-shikimate phosphate synthetase (EPSPS) gene (AAR26449) which is capable of conferring resistance to glyphosate. The plasmid also contained the 1-aminocyclo-propane-1-carboxylic acid (ACC) deaminase gene from Pseudomonas chloroaphis (see also AAQ27199). The transformed plants had ethylene levels reduced to about one half that of the control, untransformed plants. It is expected that such plants will show reduced senesence of flowers and leaves when compared to untransformed plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

This sequence represents the synthetic CP4 5-enolpyruvyl-3-shikimate phosphate synthase (EPSPS) gene which is capable of conferring resistance to glyphosate and is used in a novel method for producing fruit-bearing plants with delayed ripening. The method involves the expression of a 1-aminocyclopropane-1-carboxylic acid (ACC) deaminase gene in a plant at a level sufficient to reduce ethylene production in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                      herbicide in an amount inhibiting natural
5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) activity of the plant
and having at least one enzymatic activity selected from:
(1) EPSPS activity different from natural EPSPS activity of the plant or
(2) glyphosate oxidoreductase (GOX) activity different from the natural
GOX activity of the plant; and in which a gene encoding a protein having
the following properties: (a) combines specifically with a substance
participating to the herbicidic activity a herbicide of
protoporphyrinogen IX oxidase inhibiting type; (b) has substantially no
denaturing activity on a substance to which said protein combines
specifically; and (c) contains substantially no framework region of the
variable region of immunoglobulin. The present sequence is that of the
Perunia hybrida EPSPS chloroplast transit peptide and the Agrobacterium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Agrobacterium sp. strain CP4 It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, cobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22301 and AAR22302.

Anw34683-89 represent a new class of glyphosate-tolerant
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
EPSPS enzymes have little homology with known class; EPSPS enzymes, and
belong to a new class, Class II. The present sequence is from
belong to a new class, class II. The present sequence is from
Agrobacterium sp. strain CP4. The biosynthesis of aromatic compounds.

CEPSPS converts phosphoenolpyruvic acid (PEP) and 3-phosphoshikimic acid
to 5-enolpyruvyl 3-phosphoshikimic acid, and is inhibited by the
to 5-enolpyruvyl 3-phosphoshikimic acid, and is inhibited by the
containing alyphosate resistance genes so that glyphosate-containing
containing alyphosate resistance genes of the glyphosate-containing
containing alyphosate to selectively kill weeds. The novel EPSPS
carymes exhibit a low Km for PEP and a high Ki for glyphosate-tolerant, and
EPSPS enzyme activity is not affected. These class II EPSPS enzymes are
fused to a chloroplast transit peptide to target the protein into the
chlorophast, which is the site for the shikimic acid pathway. In
chlorophast, which is the site for the shikimid acid pathway. In
chlorophast, which is the site for the shikimid acid pathway. In
chlorophast, which is cloned into a plant under the control of a
daddition, the EPSPS gene is cloned into a plant under the control of a
contract such as figwort mosaic virus promoter or the cauliflower mosaic
virus promoter, so that expression is enhanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

```
An isolated 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) has the sequence domains (I), (II), and (IV): -R-XI-H-XZ-E- (I), -G-D-K-X3- (II); -S-A-Q-X4-K- (III); and -N-X5-T-R- (IV). Where X1 = G, S, T, C, Y, N, Q, D or E; X2 and X3 = S or T; X4 and X5 = A, R, N, D, C, E, G, H, I, L, K, M, F, P, S, T, W, Y or V. The EPSPS enzyme, produced by recombinant methods, can be used in kinetic studies to determine K1 and Km values of the enzyme for its characterisation. The enzyme is normally used for the production of 5-enolpyruvyl-3- phosphoshikimic acid in plants, and most forms of the enzyme are

Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

inhibited by N-phosphonomethylglycine ('glyphosate') herbicides. Inhibition data enables more accurate values of concentrations of herbicide to be used when growing the plant without being detrimental to it. This enables the plant to be grown in the presence of the herbicide, being used to inhibit the growth of undesired plants. The present sequence represents a class II EPSPS from bacterial isolate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

genomic DNA encoding 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme referred to as class II EPSPS enzyme which is tolerant to glyphosate. EPSPS genes are useful in producing transformed bacteria and transgenic plants which are tolerant to glyphosate herbicide. The probe is useful for identifying the presence of a target genomic DNA encoding a EPSPS enzyme. The present sequence is Agrobacterium sp. strain CP4 class II EPSPS protein.

Note: The present sequence, SED ID NO: 3 is stated as amino acid sequence throughout the specification. However, it is referred as probe in claim 3 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glyphosate tolerant bacteria; herbicides; glyphosate resistant plants; 5'-enolpyruvylshikimate-3-phosphate synthase; weed control.

The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control See also AAR22300 and AAR22300.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Pseudomonas sp. strain PG2982 It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. ccnn wheat, rice, oilseed rape, cobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22301.

AAW24479 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme. Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.

chromosome of Synechocystis 6803.";
FEBS Lett. 325:255-261(1993).

-!- CATALYTIC ACTIVITY: Phosphoenolpyruvate + 3-phosphoshikimate - phosphate + 5-0-(1-carboxyviny1)-3-phosphoshikimate.

-!- PATHWAY: SIXTH STEP IN THE BIOSYNTHESIS OF CHORISMATE WITHIN THE BIOSYNTHESIS OF AROMATIC AMINO ACIDS (THE SHIKIMATE PATHWAY).

-!- SUBURIT: MONOMER (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).

-!- SIMILARITY: BELONGS TO THE EPSP SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PLREMGVQV-KSEDGDRLPVTLRGPKTPTPITYRVPMASAQVKSAVLLAGLNTPGITTVI 194
